

# 案件人物关系管理方案

2026年03月14日 v1.0

## 案件人物关系管理方案

文档版本：v1.0

编写日期：2026年3月14日

开发负责人：王舟

### 一、需求分析

#### 1.1 典型场景

一个案件往往涉及多个人物，例如：

案件：张三诉李四合同纠纷

涉及人物：

- 当事人
  - 张三（原告）
  - 李四（被告）
- 代理人
  - 王五（张三的律师）
  - 赵六（李四的律师）
- 证人
  - 钱七（合同签署见证人）
  - 孙八（录音提供者）
- 证据链中的人物
  - 周九（收款人，银行流水中出现）
  - 吴十（合同盖章的公司法人代表）
  - 郑十一（邮件往来中的联系人）
- 其他相关人员
  - 法官

## 1.2 核心需求

| 需求        | 说明              | 优先级 |
|-----------|-----------------|-----|
| 人物统一管理    | 同一人在不同证据中只创建一次  | P0  |
| 角色分类      | 区分当事人/证人/代理人/其他 | P0  |
| 人物 - 案件关联 | 一个人与多个案件可能有关联   | P0  |
| 人物 - 证据关联 | 某人在某证据中出现       | P1  |
| 人物 - 人物关系 | 如"张三是李四的代理人"    | P1  |
| 人物关系图谱    | 可视化展示人物关系网      | P2  |
| 人物搜索      | 按姓名/角色/电话搜索     | P1  |

## 1.3 人物信息要素

| 信息类型 | 字段             | 说明            |
|------|----------------|---------------|
| 基本信息 | 姓名、性别、身份证号     | 核心识别信息        |
| 联系方式 | 电话、邮箱、地址       | 联系用           |
| 角色信息 | 案件角色、与当事人关系    | 如"原告"、"被告代理人" |
| 扩展信息 | 工作单位、职务        | 背景信息          |
| 关联信息 | 关联证据、关联节点、关联人物 | 关系网           |

## 二、数据库设计

### 2.1 核心表结构

```
-- 人物信息表
CREATE TABLE persons (
  -- 主键
  id          TEXT PRIMARY KEY,

  -- 基本信息
  name        TEXT NOT NULL,          -- 姓名
  name_pinyin TEXT,                   -- 姓名拼音 (搜索优化)
  gender      TEXT,                   -- 性别: male/female/unknown
  id_number   TEXT,                   -- 身份证号 (加密存储)
  id_number_hash TEXT,                -- 身份证号哈希 (去重)

  -- 联系方式
  phone       TEXT,                   -- 电话
  phone_hash  TEXT,                   -- 电话哈希 (去重)
  email       TEXT,                   -- 邮箱
  address     TEXT,                   -- 地址

  -- 扩展信息
  organization TEXT,                  -- 工作单位
  position     TEXT,                  -- 职务
  notes        TEXT,                  -- 备注

  -- 统计信息 (冗余, 方便查询)
  related_cases_count INTEGER DEFAULT 0, -- 关联案件数
  related_evidence_count INTEGER DEFAULT 0, -- 关联证据数
  related_nodes_count INTEGER DEFAULT 0, -- 关联节点数

  -- 状态
  status       TEXT DEFAULT 'active', -- active/archived/deleted
  created_by   TEXT NOT NULL,
  created_at   DATETIME DEFAULT CURRENT_TIMESTAMP,
  updated_at   DATETIME DEFAULT CURRENT_TIMESTAMP,

  -- 索引
  INDEX idx_name ON persons(name),
  INDEX idx_name_pinyin ON persons(name_pinyin),
  INDEX idx_phone ON persons(phone),
  INDEX idx_id_hash ON persons(id_number_hash)
);
```

```

-- 人物 - 案件关联表
CREATE TABLE person_case_links (
    id TEXT PRIMARY KEY,
    person_id TEXT NOT NULL REFERENCES persons(id),
    case_id TEXT NOT NULL REFERENCES cases(id),

    -- 角色信息
    role_type TEXT NOT NULL, -- 角色类型
    role_detail TEXT, -- 角色详细描述

    -- 时间信息
    involved_date DATE, -- 涉案日期
    created_at DATETIME DEFAULT CURRENT_TIMESTAMP,

    -- 索引
    INDEX idx_person ON person_case_links(person_id),
    INDEX idx_case ON person_case_links(case_id),
    INDEX idx_role ON person_case_links(role_type),
    UNIQUE INDEX idx_unique (person_id, case_id, role_type)
);

-- 人物 - 证据关联表
CREATE TABLE person_evidence_links (
    id TEXT PRIMARY KEY,
    person_id TEXT NOT NULL REFERENCES persons(id),
    evidence_id TEXT NOT NULL REFERENCES evidence_files(id),

    -- 关联信息
    mention_type TEXT, -- 出现类型: signatory/witness/mentioned
    mention_context TEXT, -- 出现上下文 (原文片段)
    page_num INTEGER, -- 所在页码
    position INTEGER, -- 文中位置

    -- 索引
    INDEX idx_person ON person_evidence_links(person_id),
    INDEX idx_evidence ON person_evidence_links(evidence_id)
);

-- 人物 - 节点关联表
CREATE TABLE person_node_links (
    id TEXT PRIMARY KEY,
    person_id TEXT NOT NULL REFERENCES persons(id),
    node_id TEXT NOT NULL REFERENCES event_nodes(id),

    -- 关联信息
    relation_desc TEXT, -- 与该事件的关系描述

```

```

-- 索引
INDEX idx_person ON person_node_links(person_id),
INDEX idx_node ON person_node_links(node_id)
);

-- 人物 - 人物关系表
CREATE TABLE person_person_relations (
    id TEXT PRIMARY KEY,
    person_a_id TEXT NOT NULL REFERENCES persons(id),
    person_b_id TEXT NOT NULL REFERENCES persons(id),

    -- 关系信息
    relation_type TEXT NOT NULL,          -- 关系类型
    relation_desc TEXT,                  -- 关系描述
    relation_date DATE,                  -- 关系发生日期

    -- 关系方向: A→B
    -- 如: 张三是李四的"代理人"

    -- 索引
    INDEX idx_a ON person_person_relations(person_a_id),
    INDEX idx_b ON person_person_relations(person_b_id),
    INDEX idx_relation ON person_person_relations(relation_type),
    UNIQUE INDEX idx_unique (person_a_id, person_b_id, relation_type)
);

-- 角色类型字典表
CREATE TABLE role_types (
    id TEXT PRIMARY KEY,
    code TEXT UNIQUE NOT NULL,          -- 角色代码
    name TEXT NOT NULL,                 -- 角色名称
    category TEXT NOT NULL,             -- 分类: party/agent/witness/other
    description TEXT,
    color TEXT                          -- 显示颜色
);

```

## 2.2 角色类型预设

```

-- 初始化角色类型
INSERT INTO role_types (id, code, name, category, color) VALUES
-- 当事人
('role_001', 'plaintiff', '原告', 'party', '#ef4444'),
('role_002', 'defendant', '被告', 'party', '#3b82f6'),
('role_003', 'third_party', '第三人', 'party', '#f59e0b'),

-- 代理人

```

```
( 'role_010', 'lawyer', '代理律师', 'agent', '#8b5cf6'),
( 'role_011', 'legal_rep', '法定代表人', 'agent', '#8b5cf6'),
( 'role_012', 'agent', '一般代理人', 'agent', '#8b5cf6'),

-- 证人
( 'role_020', 'witness', '证人', 'witness', '#10b981'),
( 'role_021', 'expert', '鉴定人', 'witness', '#10b981'),

-- 其他
( 'role_030', 'signatory', '签署人', 'other', '#6b7280'),
( 'role_031', 'payee', '收款人', 'other', '#6b7280'),
( 'role_032', 'contact', '联系人', 'other', '#6b7280'),
( 'role_033', 'other', '其他', 'other', '#6b7280');
```

## 2.3 人物关系类型预设

```
-- 初始化人物关系类型
INSERT INTO role_types (id, code, name, category) VALUES

-- 亲属关系
( 'rel_001', 'spouse', '配偶', 'family'),
( 'rel_002', 'parent', '父母', 'family'),
( 'rel_003', 'child', '子女', 'family'),
( 'rel_004', 'sibling', '兄弟姐妹', 'family'),

-- 工作关系
( 'rel_010', 'employer', '雇主', 'work'),
( 'rel_011', 'employee', '雇员', 'work'),
( 'rel_012', 'colleague', '同事', 'work'),

-- 法律关系
( 'rel_020', 'agent', '代理人', 'legal'),
( 'rel_021', 'client', '委托人', 'legal'),
( 'rel_022', 'guarantor', '担保人', 'legal'),

-- 业务关系
( 'rel_030', 'partner', '合作伙伴', 'business'),
( 'rel_031', 'counterparty', '交易对手', 'business');
```

## 三、Rust 后端实现

---

### 3.1 数据模型

```
// src/models/person.rs
use chrono::{NaiveDate, DateTime, Utc};
use serde::{Deserialize, Serialize};
use sqlx::FromRow;
use uuid::Uuid;

/// 人物角色类型
#[derive(Debug, Clone, Serialize, Deserialize, PartialEq)]
#[serde(rename_all = "snake_case")]
pub enum RoleType {
    // 当事人
    Plaintiff,
    Defendant,
    ThirdParty,

    // 代理人
    Lawyer,
    LegalRep,
    Agent,

    // 证人
    Witness,
    Expert,

    // 其他
    Signatory,
    Payee,
    Contact,
    Other,
}

/// 人物信息
#[derive(Debug, Clone, FromRow, Serialize, Deserialize)]
pub struct Person {
    pub id: String,
    pub name: String,
    pub name_pinyin: Option<String>,
    pub gender: Option<String>,
    pub id_number_hash: Option<String>,
    pub phone: Option<String>,
}
```

```

    pub phone_hash: Option<String>,
    pub email: Option<String>,
    pub address: Option<String>,
    pub organization: Option<String>,
    pub position: Option<String>,
    pub notes: Option<String>,
    pub related_cases_count: i64,
    pub related_evidence_count: i64,
    pub related_nodes_count: i64,
    pub status: String,
    pub created_by: String,
    pub created_at: DateTime<Utc>,
    pub updated_at: DateTime<Utc>,
}

/// 人物 - 案件关联
#[derive(Debug, Clone, FromRow, Serialize, Deserialize)]
pub struct PersonCaseLink {
    pub id: String,
    pub person_id: String,
    pub case_id: String,
    pub role_type: String,
    pub role_detail: Option<String>,
    pub involved_date: Option<NaiveDate>,
    pub created_at: DateTime<Utc>,
}

/// 人物 - 人物关系
#[derive(Debug, Clone, FromRow, Serialize, Deserialize)]
pub struct PersonPersonRelation {
    pub id: String,
    pub person_a_id: String,
    pub person_b_id: String,
    pub relation_type: String,
    pub relation_desc: Option<String>,
    pub relation_date: Option<NaiveDate>,
}

/// 人物完整信息 (含关联)
#[derive(Debug, Clone, Serialize, Deserialize)]
pub struct PersonWithRelations {
    #[serde(flatten)]
    pub person: Person,
    pub case_links: Vec<PersonCaseLink>,
    pub evidence_links: Vec<PersonEvidenceLink>,
}

```

```
pub person_relations: Vec<PersonPersonRelation>,  
}
```

## 3.2 人物服务

```
// src/services/person_service.rs  
use sqlx::{SqlitePool, FromRow};  
use crate::models::person::*;  
  
pub struct PersonService {  
    pool: SqlitePool,  
}  
  
impl PersonService {  
    pub fn new(pool: SqlitePool) -> Self {  
        Self { pool }  
    }  
  
    /// 创建人物（自动去重）  
    pub async fn create_or_find_person(  
        &self,  
        input: CreatePersonInput,  
    ) -> anyhow::Result<Person> {  
        // 1. 尝试通过身份证号哈希查找  
        if let Some(id_hash) = &input.id_number_hash {  
            if let Some(person) = self.find_by_id_hash(id_hash).await? {  
                return Ok(person);  
            }  
        }  
  
        // 2. 尝试通过电话哈希查找  
        if let Some(phone_hash) = &input.phone_hash {  
            if let Some(person) = self.find_by_phone_hash(phone_hash).await? {  
                return Ok(person);  
            }  
        }  
  
        // 3. 尝试通过姓名 + 其他信息查找  
        if let Some(person) = self.find_by_name_and_info(&input.name, &input).await? {  
            return Ok(person);  
        }  
  
        // 4. 创建新人物  
        let person = Person {  
            id: Uuid::new_v4().to_string(),  
        }  
    }  
}
```

```

        name: input.name,
        name_pinyin: Some(self.convert_to_pinyin(&input.name)),
        gender: input.gender,
        id_number_hash: input.id_number_hash,
        phone: input.phone,

}

```

### 3.3 人物去重逻辑

```

// src/services/person_dedup.rs

/// 人物去重服务
pub struct PersonDedupService {
    pool: SqlitePool,
}

```

```

}

impl PersonDedupService {
    /// 查找相似人物（用于去重提示）
    pub async fn find_similar_persons(
        &self,
        input: &CreatePersonInput,
        threshold: f64,
    ) -> anyhow::Result<Vec<(Person, f64)>> {
        let mut candidates = Vec::new();

        // 1. 身份证号匹配（精确）
        if let Some(id_hash) = &input.id_number_hash {
            if let Some(person) = self.find_by_id_hash(id_hash).await? {
                candidates.push((person, 1.0));
                return Ok(candidates); // 精确匹配，直接返回
            }
        }

        // 2. 电话匹配（精确）
        if let Some(phone_hash) = &input.phone_hash {
            if let Some(person) = self.find_by_phone_hash(phone_hash).await? {
                candidates.push((person, 0.95));
            }
        }

        // 3. 姓名 + 其他信息匹配（模糊）
        let similar = self.find_by_similar_name(&input.name, &input).await?;
        for person in similar {
            let score = self.calculate_similarity(&person, input);
            if score >= threshold {
                candidates.push((person, score));
            }
        }

        // 按相似度排序
        candidates.sort_by(|a, b| b.1.partial_cmp(&a.1).unwrap());

        Ok(candidates)
    }

    /// 计算相似度
    fn calculate_similarity(
        &self,
        existing: &Person,
        input: &CreatePersonInput,
    ) -> f64 {

```

```

        let mut score = 0.0;
        let mut weights = 0.0;

        // 姓名匹配 (40% 权重)
        if existing.name == input.name {
            score += 0.4;
        } else if self.is_name_similar(&existing.name, &input.name) {
            score += 0.2;
        }
        weights += 0.4;

        // 电话匹配 (30% 权重)
        if let Some(phone) = &input.phone {
            if existing.phone.as_ref() == Some(phone) {
                score += 0.3;
            }
        }
        weights += 0.3;

        // 单位匹配 (20% 权重)
        if let Some(org) = &input.organization {
            if existing.organization.as_ref() == Some(org) {
                score += 0.2;
            }

    Ok(())
}
```

## 四、API 接口设计

### 4.1 人物管理接口

| 方法     | 路径                        | 说明     |
|--------|---------------------------|--------|
| POST   | /api/v1/persons           | 创建人物   |
| GET    | /api/v1/persons           | 搜索人物列表 |
| GET    | /api/v1/persons/:id       | 获取人物详情 |
| PUT    | /api/v1/persons/:id       | 更新人物信息 |
| DELETE | /api/v1/persons/:id       | 删除人物   |
| POST   | /api/v1/persons/:id/merge | 合并人物   |

### 4.2 人物关联接口

| 方法     | 路径                                 | 说明     |
|--------|------------------------------------|--------|
| POST   | /api/v1/persons/:id/cases          | 关联到案件  |
| DELETE | /api/v1/persons/:id/cases/:case_id | 解除案件关联 |

| 方法   | 路径                            | 说明     |
|------|-------------------------------|--------|
| POST | /api/v1/persons/:id/evidence  | 关联到证据  |
| POST | /api/v1/persons/:id/relations | 添加人物关系 |

### 4.3 人物图谱接口

```
GET /api/v1/cases/:case_id/persons/graph
```

响应示例:

```
{
  "code": 200,
  "data": {
    "nodes": [
      {
        "id": "person_001",
        "name": "张三",
        "role": "plaintiff",
        "role_name": "原告",
        "color": "#ef4444",
        "organization": "XXX 公司",
        "position": "总经理"
      },
      {
        "id": "person_002",
        "name": "李四",
        "role": "defendant",
        "role_name": "被告",
        "color": "#3b82f6"
      },
      {
        "id": "person_003",
        "name": "王五",
        "role": "lawyer",
        "role_name": "代理律师",
        "color": "#8b5cf6"
      }
    ],
    "edges": [
      {
```

```

        "source": "person_001",
        "target": "person_003",
        "relation": "agent",
        "relation_name": "代理人",
        "description": "王五是张三的代理律师"
    },
    {
        "source": "person_001",
        "target": "person_002",
        "relation": "counterparty",
        "relation_name": "交易对手",
        "description": "合同签订双方"
    }
]
}
}

```

## 五、Dioxus 前端实现

### 5.1 人物列表页面

```

// frontend/src/pages/persons.rs

#[component]
pub fn PersonsPage(case_id: String) -> Element {
    let mut search_keyword = use_signal(|| String::new());
    let mut selected_role = use_signal(|| None);
    let persons = use_resource(move || {
        let kw = search_keyword();
        let role = selected_role();
        async move {
            search_persons(&kw, role.as_deref(), Some(&case_id), 1, 50).await
        }
    });

    rsx! {
        div { class: "persons-page",
            h1 { "案件人物" }

            // 搜索栏
            div { class: "search-bar",

```

```

        input {
            r#type: "text",
            placeholder: "搜索姓名/电话/单位...",
            value: search_keyword(),
            oninput: move |e| search_keyword.set(e.value()),
        }

        select {
            oninput: move |e| selected_role.set(Some(e.value())),
            option { value: "", "全部角色" }
            option { value: "plaintiff", "原告" }
            option { value: "defendant", "被告" }
            option { value: "witness", "证人" }
            option { value: "lawyer", "律师" }
        }

        button {
            onclick: move |_| show_add_person_modal(),
            "添加人物"
        }
    }

    // 人物列表
    match &*persons.value() {
        Some(Ok(data)) => rsx! {
            div { class: "person-grid",
                for person in data.persons.iter() {
                    PersonCard {
                        person: person.clone(),
                        onclick: move |_| show_person_detail(&person.id),
                    }
                }
            },
            _ => rsx! { div { "加载中..." } }
        }
    }
}

#[component]
fn PersonCard(person: Person) -> Element {
    let role_color = get_role_color(&person.primary_role);

    rsx! {
        div { class: "person-card", style: "border-left: 4px solid {role_color}",
            onclick: move |_| {},

```

```

        div { class: "person-name",
              {person.name}
        }

        if let Some(org) = &person.organization {
            div { class: "person-org", {org} }
        }

        if let Some(pos) = &person.position {
            div { class: "person-position", {pos} }
        }

        div { class: "person-stats",
              span { "📁 {person.related_cases_count} 案件" }
              span { "📄 {person.related_evidence_count} 证据" }
        }
    }
}

```

## 5.2 人物关系图谱组件

```

// frontend/src/components/PersonGraph.rs

use vis_network::{Network, NetworkData};

#[component]
pub fn PersonGraph(case_id: String) -> Element {
    let graph_data = use_resource(move || fetch_person_graph(&case_id));

    rsx! {
        div { class: "person-graph-container",
              h3 { "人物关系图谱" }

              match &*graph_data.value() {
                  Some(Ok(data)) => rsx! {
                      Network {
                          nodes: data.nodes.clone(),
                          edges: data.edges.clone(),
                          options: NetworkOptions {
                              physics: true,
                              hierarchical: false,
                              node_spacing: 150,
                          },
                      },
                  }
              }
        }
    }
}

```

```

        on_node_click: move |node_id| {
            show_person_detail(node_id)
        },
    },
},
_ => rsx! { div { "加载图谱..." } }
}
}
}
}
}
}
}
}
}
}

```

### 5.3 人物详情侧边栏

```

// frontend/src/components/PersonDetail.rs

#[component]
pub fn PersonDetail(person_id: String, on_close: EventHandler<()>) -> Element {
    let person = use_resource(move || fetch_person_with_relations(&person_id));

    rsx! {
        div { class: "person-detail-sidebar",
            button { class: "close-btn", onclick: move |_| on_close.call(()), "x" }

            match &*person.value() {
                Some(Ok(p)) => rsx! {
                    // 基本信息
                    div { class: "section",
                        h3 { "基本信息" }
                        div { class: "info-row", "姓名: {p.person.name}" }
                        if let Some(gender) = &p.person.gender {
                            div { class: "info-row", "性别: {gender}" }
                        }

                        if let Some(phone) = &p.person.phone {
                            div { class: "info-row", "电话: {phone}" }
                        }

                        if let Some(email) = &p.person.email {
                            div { class: "info-row", "邮箱: {email}" }
                        }

                        if let Some(org) = &p.person.organization {
                            div { class: "info-row", "单位: {org}" }
                        }

                        if let Some(pos) = &p.person.position {
                            div { class: "info-row", "职务: {pos}" }
                        }
                    }
                }
            }
        }
    }
}

```

```

// 案件关联
div { class: "section",
  h3 { "案件关联" }
  for link in p.case_links.iter() {
    div { class: "case-link",
      span { class: "role-badge", style: "background: {get_role_color(&link.role_type)}" }
      span { "案件名称" }
    }
  }
}

// 关联证据
div { class: "section",
  h3 { "关联证据 ({p.evidence_links.len()})" }
  for link in p.evidence_links.iter().take(10) {
    div { class: "evidence-link",
      span { "{link.evidence_name}" }
      if let Some(page) = link.page_num {
        span { class: "page-tag", "P{page}" }
      }
    }
  }
}

// 人物关系
div { class: "section",
  h3 { "人物关系 ({p.person_relations.len()})" }
  for rel in p.person_relations.iter() {
    div { class: "person-relation",
      span { "与 " }
      strong { "{rel.other_person_name}" }
      span { "是 " }
      em { "{rel.relation_desc}" }
    }
  }
},
_ => rsx! { div { "加载中..." } }
}
}
}

```

## 六、智能识别与自动关联

### 6.1 从证据中自动识别人物

```
// src/services/person_extraction.rs

/// 从解析文本中自动识别人物
pub async fn extract_persons_from_evidence(
    evidence: &EvidenceFile,
) -> anyhow::Result<Vec<ExtractedPerson>> {
    let parsed_text = &evidence.parsed_text;

    // 1. 使用 NLP 识别人名
    let names = recognize_person_names(parsed_text);

    // 2. 识别角色上下文
    let mut persons = Vec::new();
    for name_match in names {
        let context = extract_context(parsed_text, &name_match);
        let role = infer_role_from_context(&context);

        persons.push(ExtractedPerson {
            name: name_match.text,
            position: name_match.position,
            context,
            role,
            confidence: name_match.confidence,
        });
    }

    Ok(persons)
}

/// 识别角色
fn infer_role_from_context(context: &str) -> Option<RoleType> {
    if context.contains("原告") || context.contains("上诉人") {
        Some(RoleType::Plaintiff)
    } else if context.contains("被告") || context.contains("被上诉人") {
        Some(RoleType::Defendant)
    } else if context.contains("律师") || context.contains("代理人") {
        Some(RoleType::Lawyer)
    } else if context.contains("证人") {
        Some(RoleType::Witness)
    } else if context.contains("法定代表人") {
```

```

        Some(RoleType::LegalRep)
    } else if context.contains("签字") || context.contains("签署") {
        Some(RoleType::Signatory)
    } else {
        Some(RoleType::Other)
    }
}

```

## 6.2 人物自动关联建议

```

/// 推荐可能的人物关联
pub async fn suggest_person_links(
    person_id: &str,
    case_id: &str,
) -> anyhow::Result<Vec<PersonLinkSuggestion>> {
    let person = get_person(person_id).await?;
    let mut suggestions = Vec::new();

    // 1. 同单位的人
    if let Some(org) = &person.organization {
        let same_org = find_persons_by_organization(org, case_id).await?;
        for p in same_org {
            if p.id != person_id {
                suggestions.push(PersonLinkSuggestion {
                    target_person_id: p.id,
                    relation_type: "colleague",
                    reason: format!("同在{}工作", org),
                    confidence: 0.7,
                });
            }
        }
    }

    // 2. 同电话的人
    if let Some(phone) = &person.phone {
        let same_phone = find_persons_by_phone(phone, case_id).await?;
        for p in same_phone {
            if p.id != person_id {
                suggestions.push(PersonLinkSuggestion {
                    target_person_id: p.id,
                    relation_type: "same_contact",
                    reason: "使用相同联系电话",
                    confidence: 0.9,
                });
            }
        }
    }
}

```

```

    }
}

// 3. 同证据中出现的人
let co_occurring = find_co_occurring_persons(person_id, case_id).await?;
for p in co_occurring {
    suggestions.push(PersonLinkSuggestion {
        target_person_id: p.id,
        relation_type: "co_occur",
        reason: format!("在同一证据中出现{}次", p.co_occur_count),
        confidence: 0.5 * p.co_occur_count.min(3) as f64 / 3.0,
    });
}

Ok(suggestions)
}

```

## 七、数据关系图

## 八、总结

### 8.1 核心设计

| 问题        | 解决方案                         |
|-----------|------------------------------|
| 同一人在多证据出现 | 人物表统一管理，通过哈希去重               |
| 人物角色多样    | person_case_links 表，一人可多角色   |
| 人物关系复杂    | person_person_relations 自关联表 |
| 快速找到某人    | 姓名拼音索引、电话哈希索引                |
| 可视化关系网    | 图谱数据接口 + vis-network 前端      |

### 8.2 性能优化

| 优化项  | 说明                     |
|------|------------------------|
| 拼音索引 | 支持拼音搜索中文姓名             |
| 哈希去重 | 身份证/电话哈希快速查重           |
| 统计冗余 | related_count 字段避免实时计算 |
| 分页查询 | 人物列表分页，避免一次加载过多        |
